

Tutti TL evolution – A Perfect Symbiosis of Work and Design

Bad Münden, October 2006.

The ability to create an independent company culture, including the possibility of adapting to ongoing changes in the working environment, is something which is increasing in importance. Individualised room-in-room solutions are just the way of meeting these requirements. Tutti TL evolution by Haworth represents the ideal symbiosis of design and everyday working life.

The spatial system, developed by Nicholas Bewick and Michele De Lucchi constitutes a complete concept. The individual structural elements permit not only an effortless configuration for customising room spaces, but they can also serve to create complex working environments. The internal architecture can be adapted at any time, and reconfigured as required. It is all down to the needs and wishes of the customer. Haworth has succeeded in creating a system that offers everyone an ideal working environment, custom-made to suit individual working habits, comfort requirements, and privacy levels.

Thanks to the use of an innovative profile system, structural elements can be connected quickly and simply. A single multi-purpose tool is all that is required to assemble an entire system. The special profiles are simply inserted into each other and screw-fastened. In this manner, it is possible quickly and easily to create a complete working environment from a multitude of horizontal and vertical elements.
